

EHT – Equipment Health Tracker

Intelligent Condition Monitoring and Early Fault Detection
for Rotating Equipment

Making hidden machine behavior visible

What is EHT?

EHT (Equipment Health Tracker) is a compact, intelligent condition monitoring device designed to continuously monitor the health of rotating equipment.

-  Measures vibration, sound, and temperature
-  Installed directly on motors, pumps, and rotating assets
-  Performs on-device analysis using advanced algorithms
-  Provides actionable maintenance insights, not raw data

Where EHT Is Used

EHT is designed for continuous monitoring of critical rotating equipment across industrial and building systems.

It is installed directly on the machine, close to the bearing housing, where mechanical and electrical faults originate and are most detectable.

Typical applications include:

-  Induction motors
-  Pumps
-  Fans and blowers
-  Compressors
-  Air blowers
-  Compressors

What EHT Measures

Vibration

Sound (Acoustic)

Temperature

Combining these measurements gives a **complete picture** of machine health and early warning of developing issues.

Rather than relying only on fixed alarm thresholds, EHT analyses how multiple signals evolve together over time, allowing it to identify faults at an early stage.

Combining **vibration, sound, and temperature** measurement gives a **comprehensive view** of machine health.

Combining vibration, sound, and temperature measurement gives a **comprehensive view of machine health.**

Why Motor Failures Are So Costly

Most failures in rotating equipment do not happen suddenly. They develop slowly, often unnoticed, until a sudden breakdown occurs.

- ⚠ Unexpected motor failures cause unplanned downtime
- 🏭 Production loss and comfort disruption
- 💰 Emergency repairs are often several times more expensive than planned maintenance
- 🔍 Traditional monitoring methods miss early-stage faults

The Cost of Late Detection

When a failure finally becomes visible, the consequences are often severe:

Unplanned downtime

Unexpected stoppage and loss of productivity

Production or comfort loss

Missed production targets or comfort issues in buildings

Emergency repairs

Cost significantly more than planned maintenance

Secondary damage risk

Damage to other systems or equipment

The real challenge is not the failure itself, but the **lack of early visibility**.

Who Benefits from EHT

EHT is designed for **facilities and teams** that need **reliable insight** into rotating equipment **health** without relying on specialist analysis.

Ideal for:

- ✓ **Facilities** with multiple motors, pumps, and air handlers
- ✓ Environments where downtime impacts production, comfort, or safety
- ✓ **Maintenance teams** without vibration experts on site
- ✓ **BMS-driven sites** that require actionable insights, not raw sensor data

Making the Invisible Visible

EHT continuously monitors machine behavior and detects subtle changes in vibration, sound, and temperature that indicate developing problems.

Rather than relying only on fixed alarm thresholds, EHT analyses how **multiple signals** evolve together over time, allowing it to identify faults at an early stage.

EHT detects **developing faults by understanding machine behavior**, not just by reacting to alarm limits.

Sound and vibration analysis indicate **possible cavitation** in a pump

Even when vibration levels are still within acceptable limits.

High-frequency sound combined with **rising temperature** indicates developing bearing issues

Long before traditional vibration alarms are triggered

Changes in vibration pattern around the running speed indicate misalignment or unbalance

Detected through trend analysis rather than threshold exceedance.

EHT detects developing faults by understanding machine behavior, not just by reacting alarm limits.

Integration to Client BMS

Early warning diagnostics are locally accessible, integrating seamlessly into your existing building management system.

EHT data seamlessly integrates with your BMS, giving you actionable insights for maintenance and operations.

Contact Us

Every facility is different. Every rotating asset has its own operating profile and **risks**.
EHT is designed to adapt to your application and integrate seamlessly into your existing systems.

Contact Us

Every facility is different.

- ✓ **Contact us** to discuss your monitoring needs.
- ✓ **Tell us** about your equipment and operating environment.
- ✓ **Let us** show how EHT can deliver meaningful maintenance insights for your assets.

We are ready to provide a customized solution to fit your exact needs.
